                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a purified nucleic acid of a Ketogulonigenium plasmid endogenous to strain NRRL B-30035. The polynucleotide can be used in a vector. The vector comprises either (i) the polynucleotide and a marker gene or (ii) the polynucleotide, a promoter, a transcription terminator and a discrete series of restriction endonuclease recognition sites between the promoter and transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAS18307
                                                                                                                                                                                                                                    The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADMJ91. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the Ketogulonigenium endogenous plasmid pADMZ91.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (ARCH )

Novel nucleic acid vector comprising Ketogulonigenium replicon found a specific deposited endogenous plasmid, useful for producing polypeptides and/or transcripts by culturing host cells transformed with vector -

Claim 4; Fig 4; English

The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coll, enable the cloning of certain genes of Ketogulonigenium in E.coll as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the region of Ketogulonigenium endogenous plasmid pADM291 that supports plasmid vector replication.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the replicon of Ketogulonigenium endogenous plasmid pADM291.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid vector comprising Ketogulonigenium replicon found a specific deposited endogenous plasmid, useful for producing polypeptides and/or transcripts by culturing host cells transformed with vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     D'Elia J;

The present invention relates to the isolation of vectors comprising a Ketoguloniqenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coll, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for
                                                                                                                      Claim
                                                                                                                                                      Novel nucleic acid vector comprising Ketogulonigenium replicon foun a specific deposited endogenous plasmid, useful for producing polypeptides and/or transcripts by culturing host cells transformed
                                                                                                                                                                                                                                                                                                                                                                                                                         Cloning vector; Ketogulonigenium replicon; endogenous plasmid; transformed host cell; Escherichia coli; pADM291-4; circular; shuttle vector plasmid; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4935

                                                                                                                                                                                                                                                                        This is the nucleotide sequence of the plasmid pNGR234a isolated from Rhizobium sp. NGR234. Open reading frames (ORF) derivable from the nucleotide sequence are claimed. The nucleotide sequences or ORFS can be used e.g. in the transportation of compounds to and from an organism be used e.g. in the transportation of compounds to and from an organism which is a host to at least one of the nucleotide sequences, ORFS or proteins, the degradation and/or metabolism of organic, inorganic, natural or xenobiotic substances in a host organism or the modification natural or xenobiotic substances in a host organism or the modification of the host range, nitrogen fixation abilities; for obtaining a synthetic minimal set of ORFS required for functional Rhizobium-legume symbiosis, especially for nodulation efficiency on host plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated symbiotic plasmid from Rhizobium sp. NGR234 - used to develop products for modifying plant characteristics, e.g. nitrogen fixation, synthesis of compounds and stress response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Broughton WJ,

                                                                                                                   Ax The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of movel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CC genes themselves and the encoded proteins. The prokaryotes used are CC genes themselves and the encoded proteins. The prokaryotes used are CC invention is also useful for the identification of potential new targets CC invention is also useful for the identification of potential new targets to identify proteins used in proliferation, to express these proteins, to identify proteins used in proliferation, to express these proteins. CC and to obtain antibodies capable of binding to the expressed proteins. CC and to obtain antibodies capable of binding to the expressed proteins. CC are proteins can be used to screen compounds in rational drug discovery CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery CC as wide variety of organisms. The present sequence encodes an accessing the protein of the printed specification, but was obtained in electronic CC of the printed specification, but was obtained in electronic cf from at directly from WIPO at the protein that protein the protein that protein the protein the protein that protein the protein the protein that protein t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
       The invention relates to an isolated and purified nucleic acid segmer comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycipikromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the produc of biologically active macrolides. The macrolide biosynthetic protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents the desogamine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              narbomycin. The alternative termination of polyketide synthesis may useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are use biopolymers, e.g., in packaging or biomedical applications, to as biopolymers, e.g., packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active ages of the produced by the compound of the produced by the produ
                                                                                                                                                                                                       neomethymycin; narbomycin; polyhydroxyalkanoate monomer synthase biopolymer; antibiotic; chemotherapeutic; immunosuppressant; ast chronic obstructive pulmonary disease; respiratory inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1758

The invention relates to an isolated and purified nucleic acid segment cc comprising a desosamine biosynthetic gene cluster, a fragment or its cc biologically active variant, where the nucleic acid sequence is not cc derived from the eryC gene cluster of saccharopolyspora crythraea or cc streptomyces antibioticus. The invention also relates to a macrolide cc biosynthetic gene cluster, or fragments thereof. The macrolide cc biosynthetic gene cluster encodes proteins which synthesise methymycin, arabomycin or a combination of these cc pikromycin, neomethymycin or augmented cells comprising the desosamine cc compounds. Recombinant or augmented cells comprising the desosamine cc and/or macrolide biosynthetic gene clusters are useful for the production cf of biologically active macrolides. The macrolide biosynthetic proteins care useful for synthesis of methymycin, pikromycin, neomethymycin and are useful for the alternative termination of polyketide synthesis may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, such as chemotherapeutics, immunosuppressants, agents to reat asthma chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., basteria including multi-drum resistant pneumonomi and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pacteria, including multi-drug resistant pneumococci and other prespiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine polyketic gene cluster (pik) from Streptomyces venezuelae ATCC 15439, as given in figure 32.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is used to produce the recombinant DNA compounds of the invention. The specification describes a recombinant DNA compound expressing recombinant polyketide synthase genes in host cells for the production of narbonolide, narbonolide derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. The DNA compounds may also encode a C12-hydroxyalse (pick), desosamine biosynthesis and desosaminyl transferase enzymes (useful for conversion of ketolides to antibiotics), and the beta-glucosidase enzyme (involved in picromycin biosynthesis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and the beta-glucosidase enzyme (involved in picromycin biosynthesis). These compounds are also useful for increasing the antibiotic activity of a compound relative to the unhydroxylated compound. The recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant pick hydroxylase gene of Streptomyces venezuelae useful for converting ketolides to antibiotics and as antibiotics and intermediates in the synthesis of compounds with pharmaceutical value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;

CC Streptomyces venezuelae DNA insert. The cosmid contains open reading CC frames which encode the various modules of the narbonolide polyketide CC synthase (PKS). The invention relates to recombinant DNA containing a CC coding sequence for a narbonolide PKS. Polyketides are compounds CC synthesised from 2-carbon units through a series of condensations and CC subsequent modifications. Modular PKS are responsible for the production CC of many antibiotics including picromycin. The narbonolide PKS consists of condensations and containing module, six extender modules, and two thioester domains. Four CC proteins make up the narbonolide PKS (PICAI, PICAII, PICAII, PICAII, PICAII, PICAII, PICAII, PICAII and PICAIV). CC proteins make up the narbonolide PKS (PICAI, PICAII, PICAII and PICAIV). CC proteins make up the narbonolide PKS (PICAI, PICAII, PICAIII). PICAIII and PICAIV). CC proteins make up the narbonolide and extender modules 1 and 2, PICAII are protein includes extender modules 3 and 4, PICAII includes extender module 5 and cc picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes extender module 6 and a type II thioesterase domain. The CC picaiv includes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a mammalian type Cre recombinase gene. This sequence can be modified so as to have a high expression efficiency mammal by selecting a codon of high frequency for use in the mammal expressing Cre recombinase. The gene can be used in organ transplantation, gene therapy and creation of animal disease models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mammalia

                                                                                                                                                                                                                                                                           6859
                                                                                                                                                                                                                                                                                                  9221
                                                                                                                                                                                                                                                                                                                       6799
                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a gene encoding a subunit of the cellulose synthates complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

                                        38952
                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the cloning and sequencing of the cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a Streptomyces noursei nystatin PKS gene cluster DNA.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB B
